

Setting up Updates

Installing Synology's newest updates should be at the top of your list. Not only do you get new features, but more importantly, you get the newest security enhancements.

1. Open **Control Panel** and select **Update & Restore**
2. Select **Update Settings** and **Automatically install** the **new update**. Pick a date and time (preferably during the middle of the night) that updates will install

The screenshot shows the Synology Control Panel interface. The left sidebar contains navigation options: Home, Search, Security, Terminal & SNMP, System, Info Center, Login Portal, Regional Options, Notification, Update & Restore (highlighted), Services, Synology Account, and Application Privileges. The main content area is titled 'DSM Update' and includes tabs for 'Configuration Backup' and 'System Reset'. A text block explains that Synology releases DSM updates periodically. Below this, system information is displayed: Model name: VirtualDSM, Current DSM version: DSM 7.0-41222 (with a link to Release notes and an info icon), and Status: Your DSM version is up-to-date. Two buttons are visible: 'Manual DSM Update' and 'Update Settings'. The 'Update Settings' modal is open, showing options to 'Select how to proceed when there is new DSM update available'. Two radio buttons are present: 'Notify me and let me decide whether to install the new update' (unselected) and 'Automatically install the new update' (selected). A 'Check schedule' section includes a dropdown menu set to 'Saturday' and two time selection boxes set to '03' and '00'.
